

The high performance butterfly valve

Features and Benefits

- The design and quality of construction ensure the highest performance, for example:
 - the double offset design avoids seat wear and a low seating torque,
 - the JHP has a high flow capacity value due to the well engineered shape of the disc and the stub shaft design,
 - the mounting plate is standardized according to ISO 5211 to adapt any type of actuator without any intermediate component.

JHP complies with the following standards:

- **Flange adaptation:**

- ISO 2084 / 7005
- EN 1092
- DIN 2501
- BS 4504
- ANSI B 16.5
- JIS B 2210
- MSS SP 44

- **Face to face:**

- ISO 5752
- EN 558-1
- NFE 29305
- DIN 3202 (K1, K2)
- BS 5155
- API 609
- MSS SP 68

Fire safe standards:

- API 607
- BS 6755-2

Applications

- General industrial utilities
- Power generation
- Automotive Industry
- Chemical petrochemical
- Food processing
- Pulp and Paper
- Ship building
- Desalination
- Off-shore
- Bitume
- Sugar mills
- Cooling industries

Technical data

- Maximum working pressure:
DN50 to DN400: PN 40
DN450 to DN600: PN 25
DN700 to DN900: PN 16
- Temperature range: -50°C to +400°C
- Vacuum: 1 Torr
- JHP is suitable to be mounted with all quarter-turn pneumatic and electric operators.
- Wafer and lugged designs are available.

No leakage

1 Seat:

Tightness is unaffected by pressure changes, or changes in flow direction as the seat can move radially in its slot.

2 Bottom end cover:

Ensures lower stem tightness by its static seal of expanded graphite.

3 Packing system:

The perfect internal tightness is obtained by a conventional packing system in expanded graphite. The excellent temperature stability ensures 100% static and dynamic tightness.

Easy accessible

4 Standardized mounting plate:

The integrally cast plate is in accordance with ISO 5211. The actuator can be directly mounted to it, eliminating the need of brackets and couplings.

5 Twin column construction:

Allows easy access to the packing system without removing the actuator.

6 Extended neck:

For easy insulation. Especially designed for isolated pipes as it allows insulation - flanges included- with easy access to the packing system. In addition any potential leak path is located outside the isolation material.

7 Centering flange:

Allows precise centering of the valve on the pipe.

8 Retaining ring:

With screws outside of flange sealing zone, which facilitates easy maintenance. In addition the uninterrupted sealing surface allows the installation of spiral wound gaskets.

Perfect shaft guiding

9 Bearings:

Double corrosion resistant bearings on upper and lower stem, providing low friction coefficient and high load capacity. The bearings avoid any deflection of shaft at the packing level, thus ensuring perfect bidirectional tightness.

10 Disc locating shoulder:

Shrunk on the shaft during assembly. It retains its position for the life of the valve and prevents displacement of disc in relation to the seat while being in service.

11 Travel stop, position indicator:

Located at the mounting plate level:

- The travel stop is set during assembly at 90° disc angle in order to avoid any over traveling of the disc. (See fig. 1)

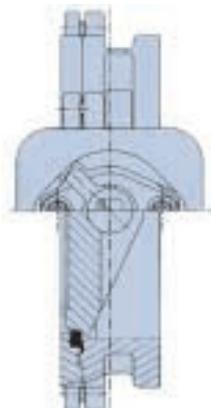

Fig. 1: Travel stop position indicator

- The travel stop contact against the mounting plate, thus avoiding potential over-torque of the discstem.

- When actuator has been removed and valve is in service, the position of the disc is clearly shown.

12 Disc to stem connection:

Via radial taper pins (no intruding between up- and downstream side of the valve), which allows accurate connection without any play between disc and stem.

Optimized design

13 Disc:

The double eccentric disc design is optimized via the finite element method so that there is no contact between the seat and disc already at small angles.

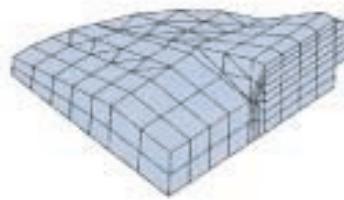

Fig. 2: Optimized design via finite element method

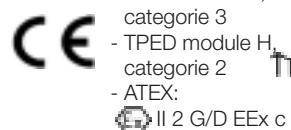

The results of this unique design are:

- No wear and low closing torque.
- A large free flow area resulting in a low headloss and high flow values.
- The disc edge has a geometry which
 - facilitates the contact between disc and seat during valve closure,
 - guarantees tightness through a wide area of contact.

The Sapag plant is ISO9001 approved

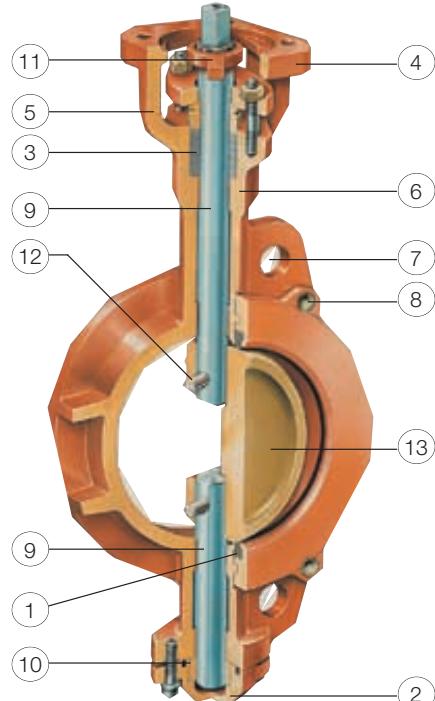

The JHP is in compliance with the latest european directives:

The JHP range holds the following approvals and certificates:

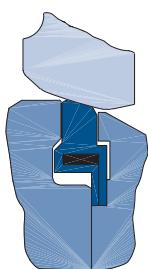

Fire safe:

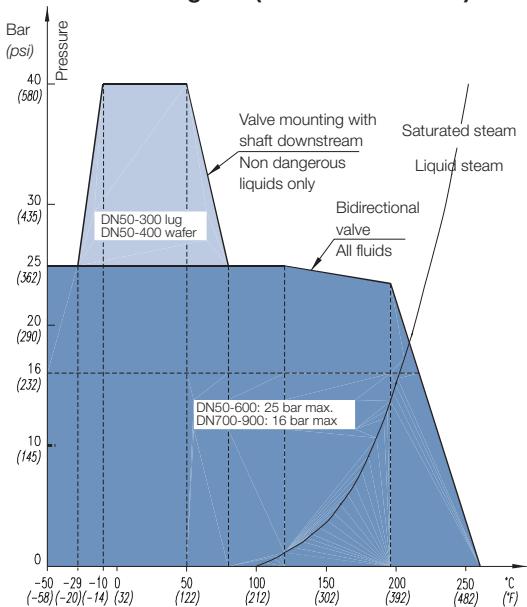

JHP RTFE (standard)

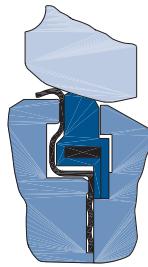

The seat is made of filled RTFE in order to minimize cold flow effects at high temperatures. The combined action of seat geometry and the elastic metal insert guarantees a long lasting bidirectional tight shutoff.

P-T diagram (JHP RTFE and FS)

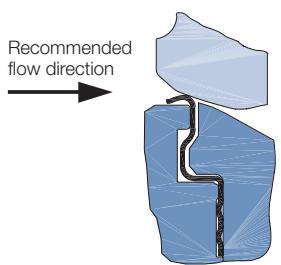

JHP FS (Fire Safe)

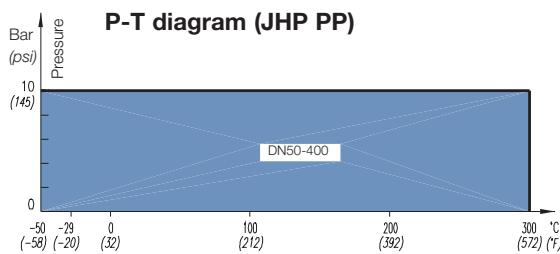

The valve has been designed according fire test standards. The standard RTFE seat is mounted with a stainless steel ring. In the event of fire, it supersedes over the RTFE seat and provides a bidirectional backup seal, according to API 607 / BS 6755 part 2.

JHP PP (Pulp and Paper)

The valve has been designed specially for the pulp and paper applications. The special seat guarantees a long life time without maintenance.

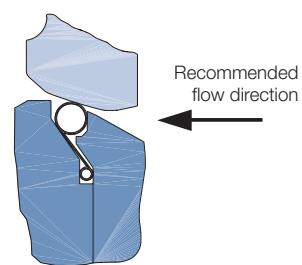

P-T diagram (JHP PP)

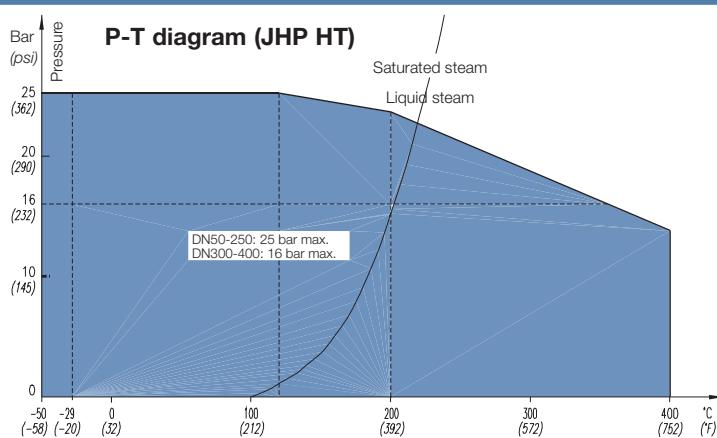

JHP HT (High Temperature)

The valve integrates a metal seat in order to be used on all applications with high pressure and high temperature.

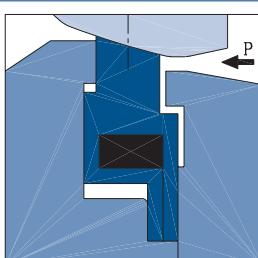

P-T diagram (JHP HT)

Bidirectional (JHP RTFE and FS)

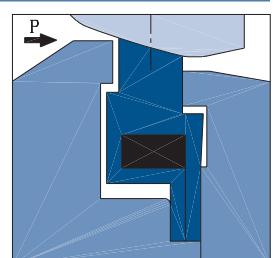

1 Seat downstream

In this case, the closing action of disc leads to compression of PTFE seat between disc and metallic insert. Subsequently, the seat takes support from the retaining ring, while the energized insert delivers a sealing pressure between disc and seat, in radial direction.

2 Seat upstream

The fluid flowing behind the seat increases the sealing effect. In fact, the JHP seat offers real dynamic tightness in both directions.

Flow coefficients K_v and C_v

K_v is the flow in m^3/h of water, at an average temperature of $20^\circ C$, crossing the valve with creating a headloss of 1 bar.

$$C_v = 1.16 K_v$$

Simplified formula

Headloss	K_v	Non compressible fluid	Gas
$\Delta p < \frac{P_1}{2}$			
$(P_2 > \frac{P_1}{2})$	K_v	$= \frac{Q}{31,6} \sqrt{\frac{P_1}{\Delta p}}$	$= \frac{Q_N}{514} \sqrt{\frac{P_{N,T}}{\Delta p \cdot P_2}}$
$\Delta p > \frac{P_1}{2}$			$= \frac{2 Q_N}{514 \cdot P_1} \sqrt{P_{N,T}}$
$(P_2 < \frac{P_1}{2})$			

Definitions

- K_v : Flow coefficient of the valve
- Q : Flow in m^3/h
- Δp : Headloss in the valve in bar
- P_1 : Upstream pressure in bar
- P_2 : Downstream pressure in bar
- Q_N : Flow in normal conditions ($0^\circ C$, 760 mm Hg) in m^3/h
- T : Temperature of the fluid in $^\circ K$
- ρ_1 : Volumic weight of the fluid in kg/m^3
- ρ_N : Volumic weight in normal conditions

 K_v values

Headloss coefficient (K_α)

For liquid, the formula of the headloss with a disc opening angle α is:

$$\Delta P_\alpha = \frac{\rho}{10 000} K_\alpha \frac{V_\alpha^2}{2g}$$

In the case of water the formula is simplified

$$\Delta H_\alpha = K_\alpha \frac{V_\alpha^2}{2g}$$

Definitions

- K_α is the headloss coefficient according to the angle to opening in which:
- ΔP_α : Headloss in a valve opened to an angle α expressed in bar
- V_α : Velocity of the fluid in a pipeline of diameter equal to the one of the valve expressed in m/s when the valve is opened to an angle α
- g : Acceleration of gravity in m/s^2
- K_α : Headloss according to the angle to opening. Results in the table
- ρ : Volumic weight of the fluid (kg/m^3)
- ΔH_α : Headloss on the valve opened to an angle α expressed in meters of water columns.

Notes

- Actuator selection valid for all JHP valves except for HT series.

Assembly on line

- Leave sufficient space between the flanges. Be sure that these edges have well aligned, parallel, and erect sealing faces.
- Put the seals between flanges and body.
- The valve is closed. Center the valve by bolting the body locator first.
- Progressively tighten diametrically opposed bolts by alternating sides until contact has been made between body, seals and the flange faces. Tighten bolts fully.
- Control after mounting: operate the valve from fully open position to fully closed position to make sure that nothing is obstructing the disc.

Notes

- : Possible for all versions
 V : Please contact factory
- These data are valid for raised face flanges only. For flat face flanges, please consult factory.
 - Please, specify requested valve drilling when ordering.

Warning:

In all cases, the line must be with the pressure relieved.

Seat replacement

- 1 Remove valve from line (closed disc).
- 2 Remove retaining ring (item 3).
- 3 Extract used seat (item 6).
- 4 Gently clean:
 - disc circle (item 2);
 - seat compartment.
- 5 Put new seat in position (still closed disc).
- 6 Re-screw retaining ring.
- 7 Reset valve between flanges and wait 15 minutes (except "PP") before any operation.
- 8 Valve is now ready to re-install.

Packing replacement

The operation can be done directly on the valve:

- without removing it from line
- 1 Unscrew gland follower (item 8) and lift packing gland (item 7).
- 2 Extract packing rings (item 10) with tool.
- 3 Clean upper stem (item 4) and packing space.
- 4 Refill packing rings.
- 5 Reset gland follower and packing gland.
- 6 Adjust packing compression to avoid leakage.

Parts list

Rep.	Number	Designation
1	1	Body
2	1	Disc
3	1	Retaining ring
4	1	Upper stem
5	1	Lower stem
6	1	Seat
7	1	Packing gland
8	1	Gland follower
9	1	Position indicator
10	*	Packing
11	4	Bearing
12	1	Disc locating shoulder
13	1	Bottom end cover
14	1	Bottom seal
15	*	Pin
16	1	Circlips Bolt

* dependent on valve size

Ordering code

A code with the following basis information is marked on the identification plate:

- four characters defining type of body, material of body, disc and seat materials
- one character or more, defining the top works (with option(s)) and type of actuator (if applicable).

For the order, completing the above data with the following information:

- the nominal diameter (DN)
- the flange
- the working pressure
- and if applicable, the valve options

Type

37 Wafer
77 Lugged

Body and disc

0 Steel
1 Stainless steel
3 Steel body and stainless steel disc

Seat

0 Reinforced RTFE
1 Fire safe FS
2 Metal PP
3 Metal HT

Top works

0 Bare shaft
1 Handle kit, type LC
3 Gear box, type MG
4 Gear box, type GS
5 Gear box, type MR
7 Gear box, type MK
8 Handle kit, type LF

Options (Top works)

B Padlock
T Switches
M Flange actuator (MG, GS, MR)
S ISOBOX (switches)
W Chainwheel

Actuators

A Pneumatic actuator
C Electric actuator
H Hydraulic actuator
P Counterweight actuator

Options

Consult us

DN (mm)

DN50 (2") - DN900 (36")

Flange: Type

(For class flanges, precise the standard).

Working pressure (CWP)

Valve options

R Shaft extension

Approvals & Certificates

FS Fire safe
M Naval Approved
T TPED Approved
X ATEX Approved

Examples

1. JHP butterfly valve with handle type LF, DN150, for mounting between flanges defined by the EN1092 in PN16

JHP 37108 - 150 PN16 PS16:

- Type (Wafer) —————— ↑ 3
- Stainles steel (body and disc) —————— ↑ 7
- Seat (reinforced RTFE) —————— ↑ 1
- Top works (bare shaft) —————— ↑ 0
- Working pressure (16 bar max) —————— ↑ 8
- Flange (EN1092 PN16) —————— ↑ 150
- DN (150) —————— ↑ PN16
- Top works (lockable lever LF) —————— ↑ PS16

2. Same valve but with metal seat PP and pneumatic actuator, working pressure of 10 bar

JHP 37120A - 150 PN16 PS10:

- Seat (metal, PP) —————— ↑ 3
- Top works (bare shaft) —————— ↑ 7
- Top works (bare shaft) —————— ↑ 1
- Top works (bare shaft) —————— ↑ 2
- Working pressure (10 bar max) —————— ↑ 0
- Actuator (pneumatic actuator) —————— ↑ A
- Flange (EN1092 PN16) —————— ↑ 150
- DN (150) —————— ↑ PN16
- Top works (lockable lever LF) —————— ↑ PS10

3. Same valve but with gear box, type MR (option: flange actuator), electric actuator, for mounting between flanges defined by EN1759, Class 150, TPED approved

JHP 37105MC - 150 EN1759 Class 150 PS16T:

- Top works (gear box, type MR) —————— ↑ 3
- Top works option (flange actuator) —————— ↑ 7
- Actuator (Electric actuator) —————— ↑ 1
- Top works (bare shaft) —————— ↑ 0
- Top works (bare shaft) —————— ↑ 5
- Top works (bare shaft) —————— ↑ M
- Top works (bare shaft) —————— ↑ C
- Flange (EN 1759 Class 150) —————— ↑ 150
- DN (150) —————— ↑ EN1759 Class150
- TPED approved —————— ↑ PS16
- Top works (lockable lever LF) —————— ↑ T
